Thermo-ceramic coating for buildings: SICC Coatings received „German Innovation Award 2018“

Berlin - In June 6th 2018, SICC Coatings GmbH was awarded the numerous “German Innovation Award 2018” in Berlin. The product ThermoShield®, an energy-saving colour coating received this award in the category “Business to Business – Building & Elements” for its innovative character. SICC Coatings is the leading provider and inventor of the energy-saving colour coatings, which are based on the thermo ceramic membrane technology with endothermic properties.

“Our focus, ever since the company was founded, is on the development, production and distribution of high-tech paints for various applications, which go beyond protective and decorative coatings.”, says Mr. Sprenger from the Department of R&D. “That our technology is honoured with the innovation award by the German Design Council, confirms our successful development work that the entire team has put in. We naturally are very proud of this and happy about the increased attention which the technology gains”, adds Mr. Waldemar Walczok, Managing Director of SICC Coatings.

The award, which makes innovation visible
The German Innovation Award labels cross-industry products and solutions, which differentiate by user-centration and added value compared to previous solutions. For: Innovations, which shape the future and improve life are available in all industries.

Sometimes visible at first sight – but often they don’t. This is what the German Innovation Award intends to change. He makes great achievements visible for a wider audience and aims to create a successful positioning on the market.

The German Innovation Awards were created by the German Design Council to fill a gap in the award scene.

Statement of the jury:

With ThermoShield® product line, it becomes clear that heating and cooling energy can be saved with a thermo-ceramic coating in a simple, economically compatible and resource-friendly way. Without environmentally polluting biocides, ThermoShield® ensures reduced algae formation on the facade and prevents mould formation in the interior area. In the long term, material-energy and workers resources are saved, expensive building materials are protected sustainably, value for future generations are preserved and the environment is spared.
